**ULTRASOUND-NECK -SINGLE PART**

***Both thyroid lobes are asymmetrically enlarged (L>>>R) and inhomogeneous in echogenicity. There are multiple well-defined, hypoechoic solid nodules of varying sizes noted in both lobes. Largest measures 1.26 x 1.26cm and 2.24 x 1.61cm for the right and left lobe respectively.***

Right lobe measures 3.96 x 2.21 x 2.41cm = **11.07ml**

Left lobe measures 5.00 x 4.74 x 3.63cm = **45.04ml**

No focal areas of calcifications seen.

Both lobes also show minimal increased flow on colour Doppler interrogation.

Isthmus is increased in thickness measuring 0.62cm.

Trachea is central

No cervical lymphadenopathy seen.

Vascular bundles of the neck are sonographically normal.

Muscular planes (strap muscles) are within normal limits.

**CONCLUSION: FEATURES ARE THOSE OF MULTI-NODULAR GOITRE**

***\*FNAC & TFT are advised for further evaluation***
