HISTOPATHOLOGY REPORT

PARAMETERS

Clinical Details : AH/24/4330

Nature of specimen : LEFT BREAST LUMP

Gross : Specimen consists of 4 soft to firm pieces of fibrofatty tissue, altogether measuring 6.5x3.5x2cm. Cut sections show yellowish to greyish-white surfaces.

Grossed by : BASSEY UNWANA

Microscopic Examination : Histological sections of breast tissue show marked intralobular lymphocytic infiltrates with the destruction of lobular architecture within which are large cells with suspicious cytologic characteristics. The nuclei of these cells are large and vacuolated with indistinct nucleoli. Only a single mitosis is visualized.

Impression : CHRONIC MASTITIS WITH SUSPICIOUS INVASIVE CARCINOMA.

Comments : Immunohistochemistry is advised to confirm malignancy.
