HISTOPATHOLOGY REPORT

<u>TEST NAME</u>	<u>RESULTUNITS</u>
Clinical Details	: AH/25/4685.
Nature of specimen	: RIGHT OVARIAN CYST.
Gross	: Specimen consists of aggregated ruptured cysts altogether measuring 21x19x4.5cm. The surface is grey to brownish, smooth to rough. Cyst wall thickness measures 0.5cm.
Grossed by	: CHIOMA CHUKWUMA.
Microscopic Examination	: Histological section of the ovary shows a cyst wall displaying a proliferative mucinous neoplasm. It is composed of architectural complexity, forming intricate papillary tufts and glandular crowding. The epithelial lining is composed of single to stratified, columnar mucinous epithelium of intestinal type with associated Goblet cells. These cells exhibit mild to moderate nuclear pleomorphism and hyperchromasia with occasional nucleoli. Mitotic figures are seen but not brisk. No evidence of stromal destructive invasion is identified.
Impression	: RIGHT OVARIAN CYST: MUCINOUS BORDERLINE TUMOUR. COMMENTS: <ul style="list-style-type: none"> • Correlate with CA125, (EA, CA19-9). • Pelvic CT surveillance. • Immunohistochemistry
